REDUCING CARBON FOOTPRINT AND ENERGY BILL IN A DISTRICT

A New Reality in the use of energy

An aerial photograph of a modern urban development. The image shows a cluster of buildings with green roofs, interspersed with trees and a winding river. A road with a bridge crosses the river. The overall scene depicts a sustainable and integrated urban environment.

Conventional gas and electricity systems are decoupled resulting in low optimization of energy, under utilization of assets, energy losses and over design.

Increased **Distributed Energy Resources** coupled with energy storage whilst addressing intermittency challenges have limited controllability and can result in network instability

District cooling systems can provide greater efficiency, but they are decoupled from other energy systems

New market mechanisms at the distribution level

Digitalization will be the common thread that spurs these technological advances

64% energy losses typically seen in manufacturing sector

U.S. Manufacturing Sector (TBtu), 2010

Source of electricity: grid, local-generation

Losses: Process Energy Loss: ~45%, Electricity Generation

Opportunity: Energy recovery processes

Our Challenges : introducing SMES (Smart Multi Energy System)

Development and demonstration of an *integrated Multi Energy Management & Information System* at a commercial *industrial* site with:

- Seamless integration of Energy Generation, Storage, & Rational End-use
- Integration of Electric, Thermal, and Gas networks
- Real-time interaction with Energy Market

NTU

JTC

To achieve substantial *energy* (at least 20%) and *cost savings* (at least 30%) resulting in at least 20% **CO2 emission reduction**.

Multi purpose port : 155
Ha
40,000 Vessels x yr.

Electricity requirements :
10MW at peak through PV which represents 60% of
the Harbour power requirements

SMES is NOT just a software, it's a solution

JURONG PORT DEPLOYMENT

SMES Operation platform : the heart of the system

Features :

- Economic dispatch
- Electric/thermal management
- Metering
- Tariff management
- Fault detection and diagnostic

Strategy :

- Forecasts for generation, consumption and prices.
- Economic **energy dispatch** (30min) Energy arbitrage, peak shaving.
- Model Predictive Control, Rolling Time Horizon.
- Rule based engine for FDD

Main Block Functions

- Data acquisition : field gateway
- Data Storage : SQL Server
- **Data Analysis : Artificial Intelligence**
- Optimization : Mathematical Prog.
- User Interface : Web Based

We can compare a portfolio of buildings with mixed energy contributions for benchmarking their energy performance

For each building we have a specific dashboard e.g., RTP

Economic dispatch for multi energy systems has been created corresponding electricity pricing contracts

Electrical economic dispatch

Thermal economic dispatch

Forecast accuracy constantly being monitored, evaluated and improved e.g., CleanTech One

Thank You
